## What is vSLAM

vSLAM
Introduction
Minh-Chung Hoang

Introduction
Feature-based vSLAM

Adading more sensors

Demonstration
Future
development
Q \& A

- Primary input data is in visual form (images).
- Algorithms Simultaneously Localize the robot And Map the environment.
- Determine instantaneous pose (localizing / odometry)
- Determine surrounding environment (mapping)
- Relocalization (loop detection)
- May include global optimization
- Why vSLAM?
- (Relatively) cheap sensors
- Rich information

## vSLAM methods

Future
development
Q \& A

- Indirect method - tracking image keypoints
- Sparse mapping - mapping keypoints' location
- Why Feature-based vSLAM?
- Robust against viewpoint and illumination changes
- Good tracking accuracy via Bundle Adjustment
- Robust relocalization via Bags-of-Words
- Less processing power requirement

## Image features

Q \& A

Individual reprojection residue:

$$
e_{j}\left(x, P_{j}\right)=h\left(x, P_{j}\right)-z_{j}
$$

Total reprojection error:

$$
S(x)=\sum_{j=1}^{M}\left\|e_{j}\left(x, P_{j}\right)\right\|_{L 2}=[\mathbf{h}(x)-\mathbf{z}]^{T}[\mathbf{h}(x)-\mathbf{z}]
$$

## Relative camera pose tracking - 2

development
Q \& A

The goal: Minimize reporjection error

$$
x^{*}=\underset{x}{\arg \min } S(x)
$$

The method: Iterative Gauss-Newton algorithm

$$
\begin{aligned}
\delta_{i} & \left.\leftarrow \frac{\partial S\left(x_{i}+\delta\right)}{\partial \delta}\right|_{\delta=0}=0 \\
x_{i+1} & \leftarrow x_{i}+\delta_{i}
\end{aligned}
$$

## Relative camera pose tracking - 3

vSLAM
Introduction
Minh-Chung Hoang

Introduction
Feature-based vSLAM

## Adding more

## sensors

Demonstration
Future
development
Q \& A

For better readability, the symbols are further simplified. Let:

$$
\begin{aligned}
\mathbf{e}_{x}=\mathbf{e}(x) & =\mathbf{h}(x)-\mathbf{z} \\
S(x) & =\mathbf{e}_{x}^{T} \Omega \mathbf{e}_{x}
\end{aligned}
$$

Applying first-order Taylor approximation:

$$
\mathbf{e}_{x+\delta}=\mathbf{e}(x+\delta) \cong \mathbf{e}_{x}+\mathbf{J}_{x} \delta \quad, \quad \mathbf{J}_{x}=\left.\frac{\partial \mathbf{e}_{x+\delta}}{\partial \delta}\right|_{\delta=0} \cong \frac{\partial \mathbf{h}(x)}{\partial \delta}
$$

Hence:

$$
\begin{aligned}
S(x+\delta) & \cong\left(\mathbf{e}_{x}+\mathbf{J}_{x} \delta\right)^{T} \Omega\left(\mathbf{e}_{x}+\mathbf{J}_{x} \delta\right) \\
& =\mathbf{e}_{x}^{T} \Omega \mathbf{e}_{x}+\mathbf{e}_{x}^{T} \Omega \mathbf{J}_{x} \delta+\delta^{T} \mathbf{J}_{x}^{T} \Omega \mathbf{e}_{x}+\delta^{T} \mathbf{J}_{x}^{T} \Omega \mathbf{J}_{x} \delta
\end{aligned}
$$

## Relative camera pose tracking - 4

vSLAM
Introduction
Minh-Chung Hoang

Introduction
Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

As derived previously:

$$
S(x+\delta) \cong \mathbf{e}_{x}^{T} \Omega \mathbf{e}_{x}+\mathbf{e}_{x}^{T} \Omega \mathbf{J}_{x} \delta+\delta^{T} \mathbf{J}_{x}^{T} \Omega \mathbf{e}_{x}+\delta^{T} \mathbf{J}_{x}^{T} \Omega \mathbf{J}_{x} \delta
$$

Taking partial derivative wrt. $\delta$ and evaluate at $x_{i}$ :

$$
\left.\frac{\partial S\left(x_{i}+\delta\right)}{\partial \delta}\right|_{\delta=0}=2 \mathbf{e}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}}+2 \delta^{T} \mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}}
$$

Therefore, in order to minimize reprojection error:

$$
\left.\frac{\partial S\left(x_{i}+\delta\right)}{\partial \delta}\right|_{\delta=0}=0 \Rightarrow \quad \mathbf{e}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}}=-\delta_{i}^{T} \mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}}
$$

Or, most importantly:

$$
\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}} \delta_{i}=-\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{e}_{x_{i}}
$$

## Gauss-Newton algorithm for camera pose estimate

## Incremental correction calculation

$$
\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}} \delta_{i}=-\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{e}_{x_{i}}
$$

(1) Initialize pose estimate $x_{i=0}=x_{\text {init }}$
(2) Collect sensor measurement $\mathbf{z}_{i}$
(3) Evaluate measurement residue $\mathbf{e}_{x_{i}}=\mathbf{h}\left(x_{i}\right)-\mathbf{z}_{i}$
(4) Initialize measurement covariance $\Omega$
(5) Evaluate Jacobian $\mathbf{J}$ at $x_{i}\left(\right.$ or $\left.\mathbf{J}_{x_{i}}\right)$
(1) Evaluate $A=\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}}$
(2) Evaluate $B=-\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{e}_{x_{i}}$
(6) Solve equation $A \delta=B$ for $\delta_{i}$
(7) Update $x_{i+1}=x_{i}+\delta_{i}$
(8) Repeat from step 2 (till convergent)

Demonstration
Future
development
Q \& A

- Lie (read as Lee : P )
- is a subset of $\mathbb{R}^{N}$
- is a group
- Closure (if $X, Y, Z \in G$ then $X Y \in G$ )
- Associativity $((X Y) Z=X(Y Z))$
- Identity (there exists $I \in G$ that $I X=X I=X$ )
- Inverse (there exists $X^{-1}$ that $X X^{-1}=X^{-1} X=I$ )
- is a smooth \& differentiable manifold $\mathfrak{M}$ in $\mathbb{R}^{N}$
- every point $p \in \mathfrak{M}$ has local Euclidean tangent space
- has an associated Lie algebra $\mathfrak{m}$
- same $k$ Degree-of-Freedom
- re-representation alg: $m \mapsto \mathfrak{m}$
- exponential map exp: $\mathfrak{m} \mapsto \mathfrak{M}$
- logarithm map log: $\mathfrak{M} \mapsto \mathfrak{m}$

\end{aligned}
$$

- Logarithm mapping: exp : $\mathfrak{S E}(3) \mapsto \mathfrak{s e}(3)$

$$
\omega=\mathfrak{w}_{\nabla}=\left[\ln \left[\mathbf{T}_{(1,1) \ldots(3,3)}\right]_{3 \times 3}\right]_{\nabla} \quad \mathbf{t}=\mathbf{A}^{-1}\left[\mathbf{T}_{(1,4) \ldots(3,4)}\right]_{3 \times 1}
$$

## *2 Why all the hassles? Let's recap

vSLAM
Introduction
Minh-Chung Hoang

Method: We decided to use Gauss-Newton (holy eqn below).

$$
\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{J}_{x_{i}} \delta_{i}=-\mathbf{J}_{x_{i}}^{T} \Omega \mathbf{e}_{x_{i}}
$$

To get state update $\delta_{i}$, practically speaking, we need:

- $\mathbf{e}_{x}$ residual $(\mathbf{f}(\mathbf{x})-\mathbf{z})$
- $\Omega$ : covariance
- $\mathbf{J}_{x}$ : Jacobian

Problem with Jacobian:

- typically $\mathbf{x} \in \mathfrak{S E}(\mathbf{3})$. Numerically, $\triangle \mathbf{x}$ has 16 dimensions.
- redundant numerical! Not sensible to differentiate!
- actually need to differentiate wrt. something of 6 DoF

Solution by Lie algebra:

- has 6 DoF via 6 generators, with mapping with $\mathbb{R}^{6}$
- unique bidirectional mapping between $\mathfrak{s e}(3)$ and $\mathfrak{S E}(3)$
- eg: $\mathbf{f}\left(\mathbf{x}_{\mathbf{0}} \oplus \triangle \mathbf{x}\right) \equiv \mathbf{f}\left(e^{[\epsilon] \times} \oplus \mathbf{x}_{\mathbf{0}}\right) \equiv \mathbf{f}_{\mathbf{x}=\mathbf{x}_{\mathbf{0}}}(\epsilon)$

## Example application: Point-to-cam projection (1)

vSLAM
Introduction
Minh-Chung Hoang

Introduction
Feature-based vSLAM

Adding more
sensors
Demonstration
Future
development
Q \& A

Let us have:
$X \in \mathfrak{S E}(3)$ : camera pose $\epsilon \in \mathbb{R}^{6}$ : small pose change $[\epsilon]_{\times} \in \mathfrak{s e}(3):$ small pose change $P \in \mathbb{R}^{4}$ : point in world frame $p \in \mathbb{R}^{3}$ : projected image point

Therefore: $e^{[\epsilon] \times}$ : pose change in $\mathfrak{S E}(3)$ $e^{[\epsilon] \times} \oplus X$ : new camera pose $X \oplus P$ : point in camera frame
$e^{[\epsilon] \times} \oplus X \oplus P$ : point in new camera frame $h\left(e^{[\epsilon] \times} \oplus X \oplus P\right)$ : new projected image point

## Example application: Point-to-cam projection (2)

vSLAM
Introduction
Minh-Chung Hoang

- Jacobian computation (finally...)

$$
\text { Let } X \oplus P=P^{\prime}=\left[p_{x}^{\prime} p_{y}^{\prime} p_{z}^{\prime}\right]^{T}
$$

$$
\mathbf{J}=\left.\frac{\partial h\left(e^{[\epsilon] \times} \oplus X \oplus P\right)}{\partial \epsilon}\right|_{\epsilon=0} \cong \frac{\partial h(X \oplus P)}{\partial(X \oplus P)} \frac{\partial\left(e^{[\epsilon] \times} \oplus X \oplus P\right)}{\partial \epsilon}
$$

$$
=\frac{\partial h\left(P^{\prime}\right)}{\partial P^{\prime}} \frac{\partial\left(e^{[\epsilon] \times} \oplus P^{\prime}\right)}{\partial \epsilon}=\left[\begin{array}{ccc}
\frac{f_{x}}{p_{z}^{\prime}} & 0 & -\frac{f_{x} p_{x}^{\prime}}{p_{z}^{\prime}} \\
0 & \frac{f_{y}^{\prime}}{p_{z}^{\prime}} & -\frac{f_{y} p_{y}^{\prime}}{p_{z}^{\prime}{ }^{2}}
\end{array}\right]\left[\begin{array}{ll}
\mathbf{I}_{3 \times 3} & \left.-\left[P^{\prime}\right]_{\times}\right]
\end{array}\right]
$$

$$
=\left[\begin{array}{cccccc}
\frac{f_{x}}{p_{z}^{\prime}} & 0 & -\frac{f_{x} p_{x}^{\prime}}{p_{z}^{\prime}} & -f_{x} \frac{p_{x}^{\prime} p_{y}^{\prime}}{p_{z}^{\prime 2}} & f_{x}\left(1+\frac{p_{x}^{\prime 2}}{p_{z}^{\prime 2}}\right) & -f_{x} \frac{p_{y}^{\prime}}{p_{z}^{\prime}} \\
0 & \frac{f_{y}}{p_{z}^{\prime}} & -\frac{f_{y} p_{y}^{\prime}}{p_{z}^{\prime 2}} & -f_{y}\left(1+\frac{p_{y}^{\prime 2}}{p_{z}^{\prime 2}}\right) & f_{y} \frac{p_{x}^{\prime} p_{y}^{\prime}}{p_{z}^{\prime 2}} & f_{y} \frac{p_{x}^{\prime}}{p_{z}^{\prime}}
\end{array}\right]
$$

## Example application: Point-to-cam projection (3)

Q \& A

Camera pose iterative update - Algorithm in a nutshell
(1) Initialize $N$ map point estimates $P_{n}$ (world frame)
(2) Initialize measurement covariance matrix $\Omega$
(3) Initialize first pose estimate $X_{0}$ (world frame)
(4) Evaluate map points in camera frame: $P_{n}^{\prime}=X \oplus P_{n}$
(5) Evaluate Jacobian matrix (the mess in the previous slide)
(6) Stack all Jacobians and covariances into " big" $\mathbf{J}_{x}$ and $\Omega$
(7) Evaluate pose increment $\epsilon$ by solving $\mathbf{J}_{x}^{T} \Omega \mathbf{J}_{x} \epsilon=-\mathbf{J}_{x}^{T} \Omega \mathbf{e}_{x}$
(8) Map $\epsilon$ into $\mathfrak{S E}(3): e^{[\epsilon] \times}$
(1) Update camera pose $X \leftarrow e^{[\epsilon] \times} \oplus X$
(10) Return to step 4 (And fasten your seat belt! $)$ )

## Some practical concerns (that I can think of)

- Step 1: Map point initialization with...monocular camera
- Step 3: Initial pose estimate
- significantly affect convergence and estimation accuracy
- zero doesn't always work
- possible motion model: zero velocity or zero acceleration
- Step 4: Data association
- Which map point to which image point
- Correspondences between consecutive images
- Correspondences between non-consecutive images

\end{array}\right]
\end{aligned}
$$

## Adding an Inertial Measurement Unit (IMU)

vSLAM
Introduction
Minh-Chung
Hoang

Introduction
Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

- Advantages
- Can be very affordable (\$2.000 USD)
- Can obtain orientation
- High data rate
- Disadvantages
- Can be very expensive (\$2,000 USD)
- Can only obtain orientation
- Unreliable heading

## Inertial Measurement Unit (IMU)

vSLAM
Introduction

Introduction
Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

Data output:

- Gyroscope: angular rotation $\left[\omega_{x} \omega_{y} \omega_{z}\right]^{T}$
- Accelerometer: gravitational vector $g\left[\begin{array}{ll}a_{x} & a_{y}\end{array} a_{z}\right]^{T}$
- Compass: magnetic vector $\left[m_{x} m_{y} m_{z}\right]^{T}$ (optional)

Data characteristics:

- Gyroscope: (quite) accurate. But integration will drift
- Accelerometer: noisy. But does not drift
- Compass: noisy. Depends on external interference Data model:
- $\phi_{\text {measured }}=\phi_{\text {true }}-\phi_{\text {bias }}+\psi$
- $\phi_{\text {bias }}$ follows Brownian motion
- $\psi$ is Gaussian noise

## Visual(vis)-Inertial(ins) vinSLAM

vSLAM
Introduction

Hoang

Introduction
Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

Self-compensating system

- IMU good at roll, pitch (and maybe yaw)
- CAM good at precise translation
- IMU is very useful in fast rotation
- CAM helps with relocalization \& heading recovery

Two approaches:

- Loosely coupled
- Tightly coupled

## Loosely-coupled vinSLAM

vSLAM
Introduction

Hoang

Introduction
Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

Two separate threads:
(1) INS: Estimate orientation based on IMU readings

- Dynamics:

$$
\left[\begin{array}{c}
\phi \\
\dot{\phi}_{b}
\end{array}\right]=\left[\begin{array}{cc}
\mathbf{I}_{3} & -\delta t \mathbf{I}_{3} \\
\mathbf{0}_{3} & \mathbf{I}_{3}
\end{array}\right]\left[\begin{array}{c}
\phi \\
\dot{\phi}_{b}
\end{array}\right]^{-}+\left[\begin{array}{c}
\delta t \mathbf{1}_{3 \times 1} \\
\mathbf{0}_{3 \times 1}
\end{array}\right][\omega]
$$

- Covariance update
- Measurement:

$$
[r]_{3 \times 1}=\left[\phi_{\text {meas }}\right]_{3 \times 1}-\left[\mathbf{I}_{3} \mathbf{0}_{3}\right]\left[\begin{array}{c}
\phi \\
\dot{\phi}_{b}
\end{array}\right]
$$

- Kalman gain
- Correction
(1) VIS: Uses INS estimates to determine initial pose estimate
- Iteratively evaluate Jacobian and update pose
- Refine orientations, but not biases

## Tightly-coupled vinSLAM

vSLAM
Introduction
Minh-Chung
Hoang

## Introduction

Feature-based vSLAM

Adding more sensors

Demonstration
Future
development
Q \& A

One single thread VINS: Simultaneously

- estimate translation
- estimate orientation
- estimate biases

## Stereo vSLAM demonstration

development
Q \& A

## Future development

vSLAM
Introduction
Minh-Chung
Hoang

Introduction
Feature-based vSLAM

Adding more
sensors
Demonstration
Future
development
Q \& A

- Immediate future
- Formulate Jacobians for tightly coupled vinsSLAM
- Implementation \& outdoor flight tests
- Adding Deep Learning
- Object constraints between map point
- Scale recovery for monocular SLAM
- Near future
- Adding downward camera and fuse 3rd cam visual odometry
- Adding terrain altimeter and fuse altitude
- Depth estimation with Monocular SLAM via Deep Learning
- CNN-based image features
- Far future

That's all, folks!
